IBM's Watson on 'Jeopardy': The machine has won

February 16, 2011 | 9:11 pm (42) (19) Comments (2)

The machine has won.

Watson defeated the two biggest "Jeopardy" winners of all time: Ken Jennings and Brad Rutter.

The IBM computer finished the final round of competition on Wednesday night with $77,147 in winnings over Jennings' $24,000 and Rutter's $21,600.

Jennings holds the record for number of consecutive Jeopardy matches won, with 74. Rutter has won more money than anyone else on Jeopardy.

The two men competed against each other in a 2005 tournament that resulted in a Rutter victory.

Since Watson won, IBM is awarded $1 million -- all of it going to charities World Vision (an anti-poverty group) and World Community Grid (which builds computer grids to address social issues such as water shortages).

How to speed up microscopes

- All the existing microscopes are limited by the narrow bandwidth of readout.
  - Just one channel of FADC (Flash Analog to Digital Converter) running at 10 – 50 MHz
  - So-called Video Rate (30 frame/sec)

- The first step is to adopt multiple channels of FADC for massive parallel processing.
  - Like high energy experiments (such as LHC)

- In addition, we need Single Photon Sensitivity with high Quantum Efficiency.

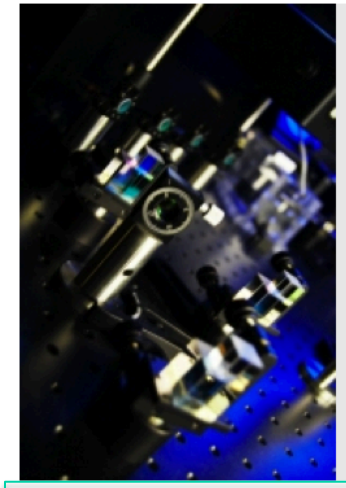
New UCLA-designed microscope records firing of thousands of individual neurons in 3-D

Imaging system could help reveal 'miscommunications' in autism, schizophrenia

By Mark Wheeler | January 11, 2011



Some disorders of the brain are obvious — the massive death of brain cells after a stroke, the explosion in the growth of cells that marks a tumor. Other disorders, such as autism, schizophrenia and mental retardation show no physical signs of damage and are believed to be caused by problems in how brain cells communicate with one another.

To understand the root of the problem of these latter diseases, visualizing brain activity is key. But even the best imaging devices available — fMRIs and PET scans — can only give a "coarse" picture of brain activity.

UCLA neuroscientists have now collaborated with physicists to develop a non-invasive, ultra–high-speed microscope that can record in real time the firing of thousands of individual neurons in the brain as they communicate, or miscommunicate, with each other.

"In our view, this is the world's fastest two-photon excitation microscope for three-dimensional imaging *in vivo*," said UCLA physics professor Katsushi Arisaka, who designed the new optical imaging system with UCLA assistant professor of neurology and neurobiology Dr. Carlos Portera-Cailliau and colleagues.

Their research appears in the Jan. 9 edition of the journal Nature Methods.

Because neuropsychiatric diseases like autism and mental retardation often display no physical brain damage, it's thought they are caused by conductivity problems — neurons not firing properly. Normal cells have patterns of electrical activity, said Portera-Cailliau, but abnormal cell activity as a whole doesn't generate relevant information that brain can use.

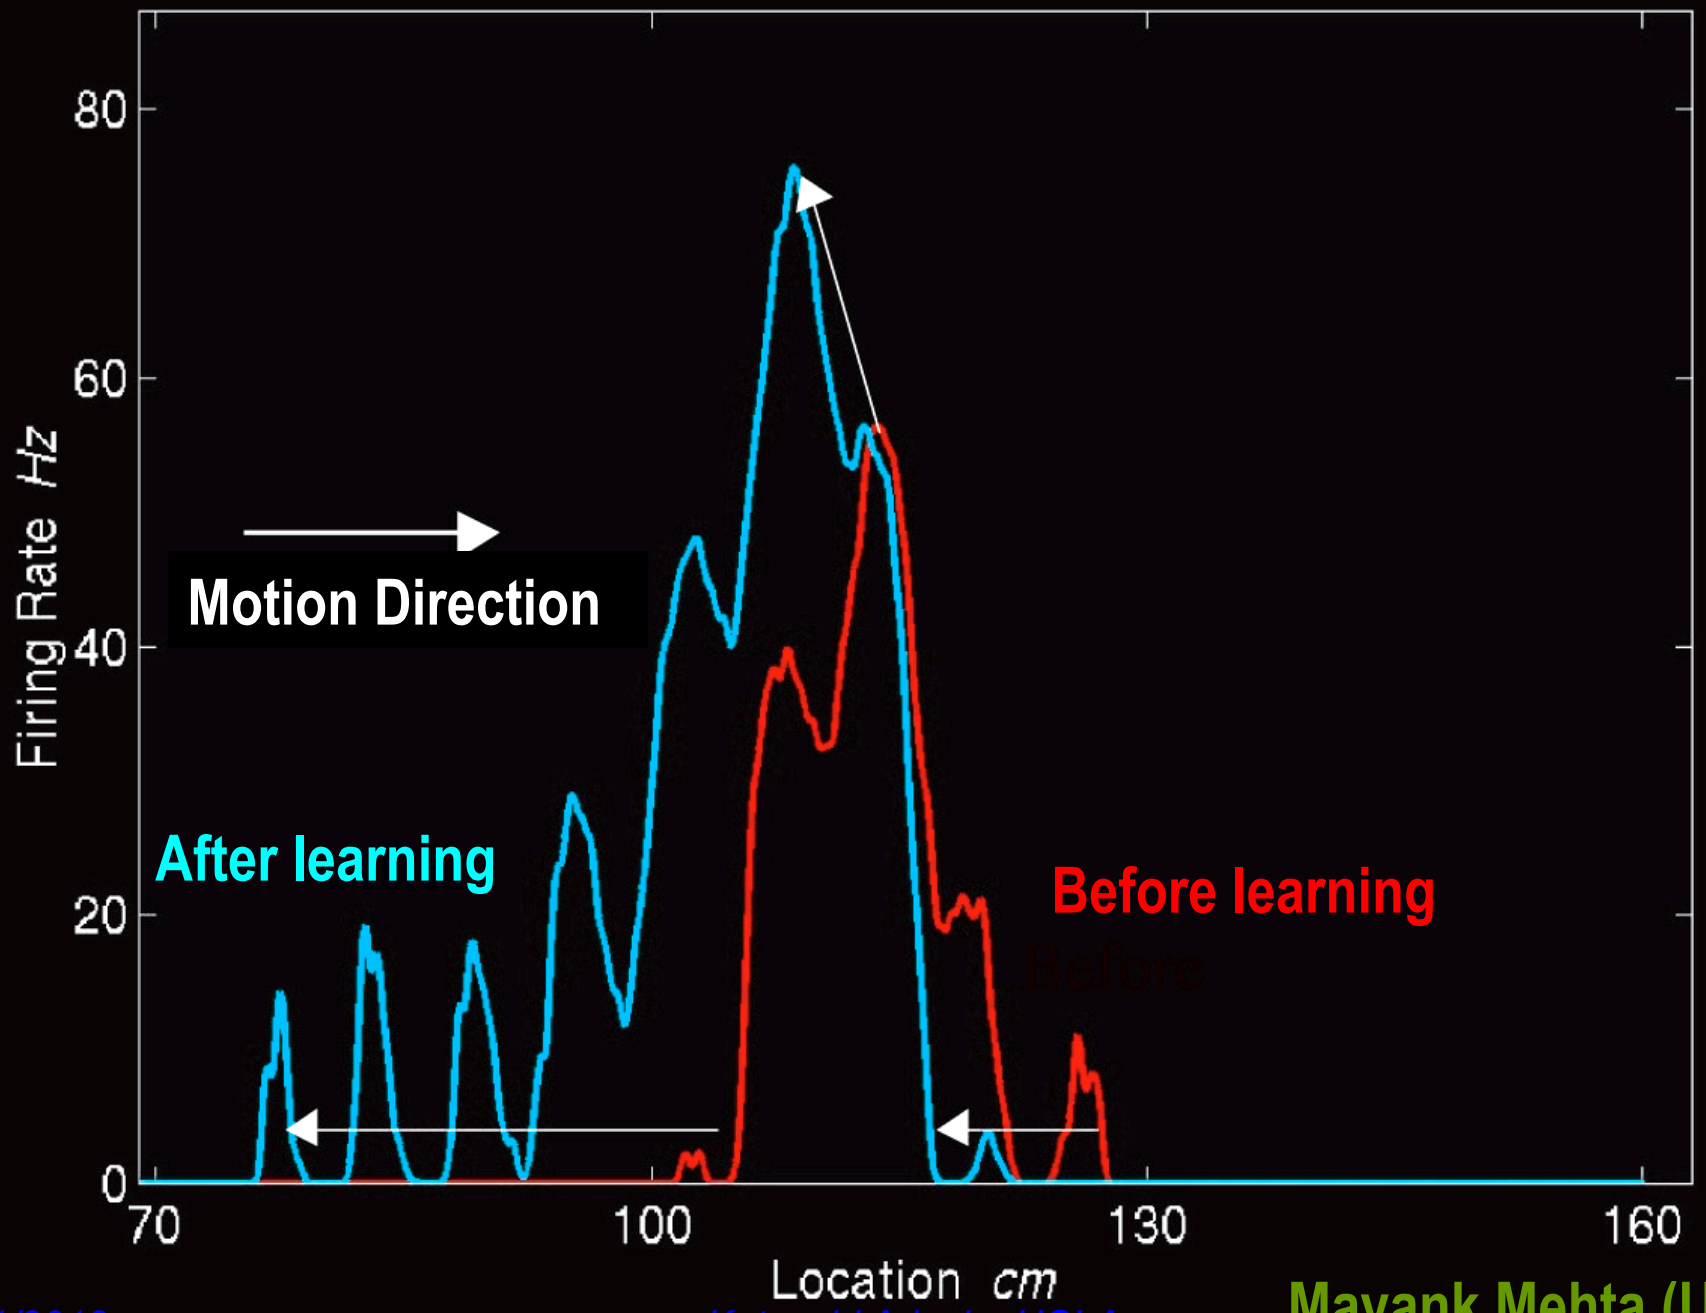
Learning and Memory by Hippocampus



Mayank Mehta (UCLA)

Origin of the Brain

- Brains were evolved for animals to predict necessary motions for survival.
  - Find preys
  - Escape away from predators
  - Find mates for sex
- A brain "consciously" makes the best decision at a given time.
- Complex activities of brains are the results of evolution of life.

Outer world vs. Inner word

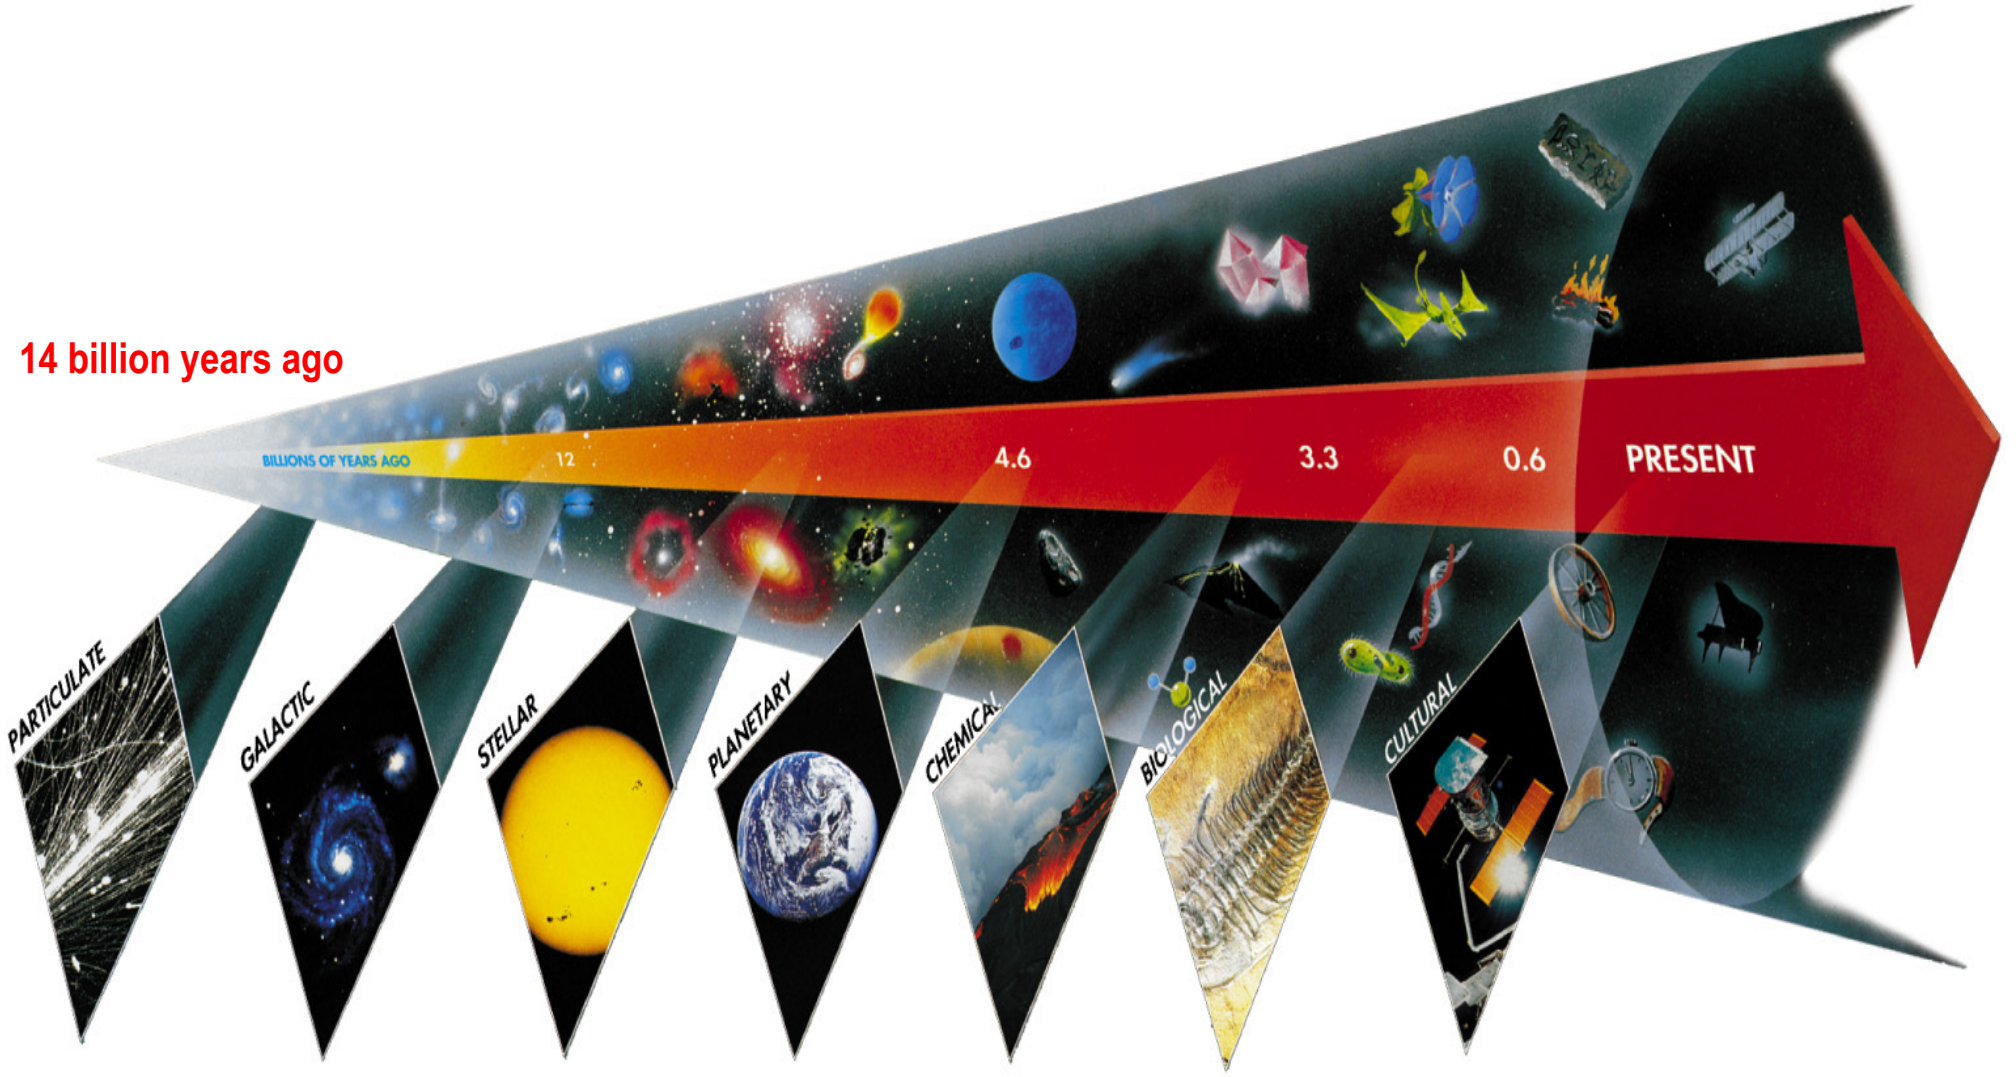
- Outer world : Five senses → Manipulate by Virtual Reality
  - Vision
  - Sound
  - Touch
  - Smell
  - Taste
- Inner world → Manipulate by Photo Excitation of single neurons
  - Neural network in brain
- Establish direct link between Inner world & Outer world
  - Control outer world – Virtual reality
  - Control inner world – Neural reality

The Origin of Consciousness

- Our brains are making enormous parallel processing "*unconsciously*" all the time.
  - Image processing
  - Language
  - Recognition of space-time
- "*Consciousness*" is merely the outcome of the decision making processes which have been performed unconsciously.
  - Language and logics are just left-over from the past.
  - We realize what we said only after we spoke.

Summary

Seven Phases of Cosmic Evolution



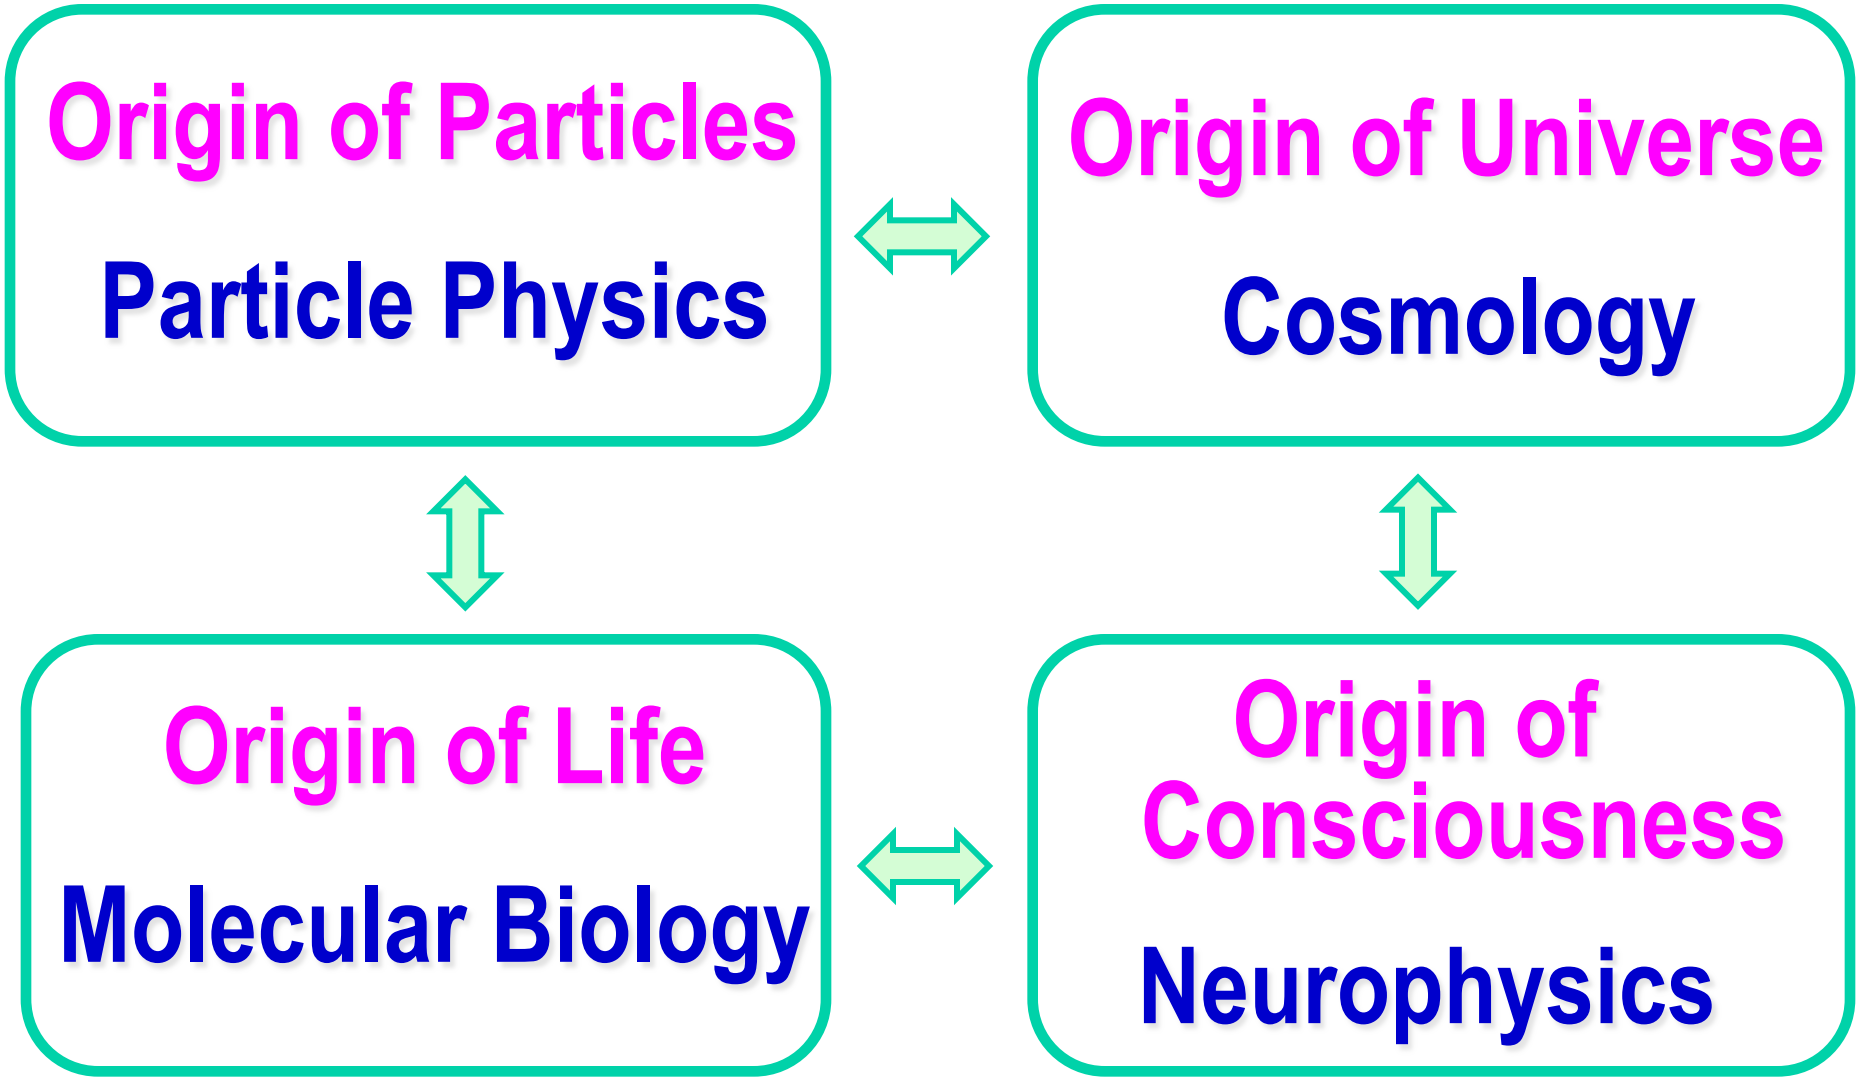
Origin of Particles

Origin of Structure

Origin of Life

Origin of Consciousness

Four Major Science



Future of Ultra High-speed Bio Imaging

- **Origin of Life:**
  - Networks of molecules in/on a cell
  - Competition against Brownian : 10 – 100 nm / 1 msec
- **Origin of Consciousness:**
  - Neural networks
  - Action potentials: 1 msec

- **> 1,000 frame/sec with nano second time stamp.**
  - Gated Image Intensified CMOS
  - Super-PIAS (GHz Photon-counting Imager)
  - 6D Imaging by Streak-CMOS Camera

Concluding Remarks

- "Life" is a complex system in 4 dimensional space-time.
  - Emergent property
  - Strongly interacting
- Countless "spontaneous symmetry breakings" during the evolutional and developing process of life
- Fully controlled experiments by "Virtual Reality" under way.
  - Outer world (environment) vs. Inner world (brain)

- "Ultra high-speed optical imaging" may reveal the fundamental principle of the brain function such as consciousness.
